

## **DESIGN AS INTENTION AND AS IMPLEMENTATION TO INTRODUCE DISTRIBUTIVITY PROPERTY**

Simone Passarella  
 University of Padova

*The aim of this contribution is to analyze a case of task designed to introduce students to the distributivity property of multiplication over addition in a meaningful way, combining the two issues of design as intention and as implementation. The process of task design is seen as a complex process that involves several steps, such as the definition of a theoretical framework (Realistic Mathematics Education) and the design of a Hypothetical Learning Trajectory. Results from a teaching experiment are reported. Starting from their informal mathematical strategies to solve a realistic task, and guided by the instructional design, students reinvented the concept of distributivity of multiplication over addition.*

### **DESIGN AS INTENTION**

Which task design can provide primary school students with opportunities to be introduced to the distributivity property of multiplication over addition (DP) in a meaningful way? The design heuristics of *guided re-invention*, *didactical phenomenology* and *emergent modelling* (Gravemeijer, 1994) permitted to formulate some hypothesis on students' learning by the definition of the components of an Hypothetical Learning Trajectory (Simon, 1995): *learning goal*: re-invention of DP; *hypothetical learning process*: students should re-invent DP by facing with the problem of performing multiplications between a 1-digit and a 2-digits number ( $26 \times 4 \rightarrow 26 = 20 + 6 \rightarrow 20 \times 4 = 80, 6 \times 4 = 24 \rightarrow 80 + 24 = 104 \Rightarrow 26 \times 4 = (20 + 6) \times 4 = (20 \times 4) + (6 \times 4)$ ); *learning activities*: group work to solve a realistic and rich (Freudenthal, 1991) problem of designing a floor tiling of their classroom using some given types of tiles.

### **DESIGN AS IMPLEMENTATION**

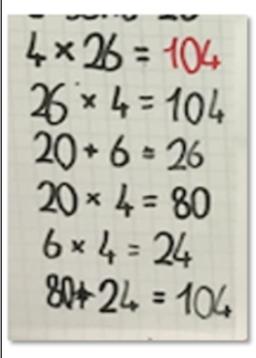

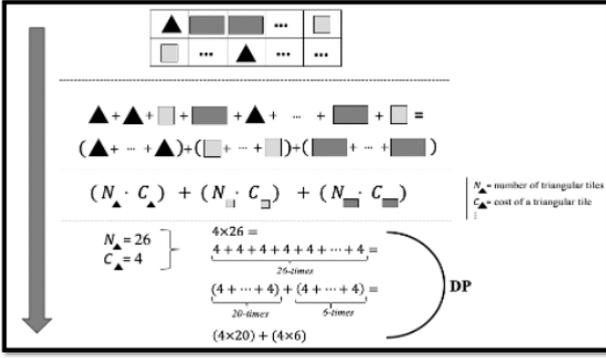

<p>S1: I write <math>6 \times 57 = 57 \times 6</math>.                  Then I divide 57 as 50 and 7...                  T: Divide?                  S1: Write...?                  T: Decompose.                  S1: Yes, I decompose 57 as 50 plus 7!                  Then I calculate <math>50 \times 6</math>.                  S2: That is 300!                  S1: Then <math>6 \times 7</math>                  S2: 42                  T: Excellent, and with these number?                  (pointing at 300 and 42)                  S1: I put them together!                  T: How?                  S1: I compose them...                  T: What does it mean?                  S1: I make the sum!</p>	 <p>(b)</p>	 <p>(c)</p>
